

interspecific differences for members of anopheline species complexes. Among the 4 putative species defined, one could be related to *An. oswaldoi* s.s., and another to *An. konderi*. Only morphological features in the male genitalia can distinguish these taxa (Causey et al. 1946), and it was impossible to make this distinction, because only wild-caught females were available. The other 2 groups may correspond to species for which morphological identification remains to be clarified in the *An. oswaldoi* complex. These points shall be addressed by ongoing studies of laboratory raised mosquito families.

Acknowledgments

We thank Lucille M. Floeter Winter (Dept. Parasitologia, ICB, USP) for excellent suggestions, Maria G. Rosa Freitas (Instituto Oswaldo Cruz, RJ) for reading and commenting on the manuscript, Luis H. S. Gil (CEPEM-RO) for providing mosquitoes from Rondônia, Marinete Póvoa (Instituto Evandro Chagas, PA) for mosquitoes from Amapá, Sérgio L. B. Luz (Instituto Oswaldo Cruz, AM) for mosquitoes from Amazonas, Yasmin Rubio Palis (Escuela de Malariaología, Maracay) for mosquitoes from Venezuela, Carmen B. Taipe Lagos (Faculdade de Saúde Pública, USP) for revision of mosquito identification, Fátima dos Santos and Oswaldo L. da Silva (Fundação Nacional de Saúde) for local support in Rondônia, Almir R. Ferreira (Instituto de Medicina Tropical, USP) for map drawing, and Frank H. Collins (Centers for Disease Control, Atlanta, GA) for providing the oligonucleotide primers used in this study. This work was supported by FAPESP, CAPES, PAPES-FIOCRUZ and Laboratórios de Investigação Médica, 49, Hospital das Clínicas, São Paulo.
